Purpose of this manual

The Safety Manual SH 3969 contains information relevant for the use of the Type 3969 Solenoid Valve in safety-instrumented systems according to IEC 61508 and IEC 61511. The safety manual is intended for planners, constructors and operators of safety-instrumented systems.

! NOTICE

Risk of malfunction due to incorrect mounting, connection or start-up of the device. Refer to the Mounting and Operating Instructions EB 3969 on how to mount the positioner, perform the electric and pneumatic connections as well as start up the device. Observe the warnings and safety instructions written in the Mounting and Operating Instructions EB 3969.

Further documentation

The documents listed below contain descriptions of the start-up, functioning and operation of the solenoid valve. You can download these documents from the SAMSON website. The documents marked with an asterisk (*) are supplied with the solenoid valve either in printed or electronic form.

- ▶ T 3969: Data sheet
- ▶ EB 3969 *: Mounting and operating instructions

i Note

In addition to the solenoid valve documentation, observe the documentation for the pneumatic actuator, valve and other valve accessories.

1 Scope

General

The Type 3969 Solenoid Valve converts binary voltage signals into pneumatic control signals. It is used to control pneumatic rotary and linear actuators with spring-return mechanism.

Use in safety-instrumented systems

Observing the requirements of IEC 61508, the systematic capability of the solenoid valve for emergency venting as a component in safety-instrumented systems is given.

Use of the solenoid valve is possible on observing the requirements of IEC 61511 and the required hardware fault tolerance in safety-instrumented systems up to SIL 2 (single device/HFT = 0) and SIL 3 (redundant configuration/HFT = 1).

The individual safety functions of the solenoid valve are to be regarded as Type A elements in accordance with IEC 61508-2.

i Note

The architecture and the interval between proof tests must be changed accordingly for a higher safety integrity level.

Versions and ordering data

All versions of the solenoid valve marked with the prefix SIL listed in the table on page 6 to 8 are suitable for use in safety-instrumented systems.

Attachment

The solenoid valve is suitable for the following types of attachment in combination with various mounting parts:

- Attachment to rotary actuators with NAMUR interface according to VDI/VDE 3845
- Attachment to linear actuators with NAMUR rib according to IEC 60534-6
- Direct attachment to mounting block with positioner according to VDI/VDE 3847 (SAMSON Type 3277 Linear Actuator)
- Pipe mounting
- Panel, wall or rail mounting

2 Technical data (excerpt from EB 3969)

General data		
Design		Solenoid with armature and ball/seat valve with return spring
Degree of protection		IP 65 with filter check valve
Compliance		CE · RoHS
Materials	Enclosure	Black anodized aluminum (C35)
	Connecting plate	Black anodized aluminum (C35)
	Adapter plate	Aluminum, powder coated, gray beige RAL 1019
	Screws	Stainless steel A4-70
	Springs	Stainless steel 1.4310
	Seals	Silicone rubber
Environmental conditions according to EN 60721-3	Storage	1K6 (relative humidity $\leq 95\%$)
	Transport	2K4
	Operation	4K4 -45 to +80 °C
Ambient temperature ¹⁾		-45 to +80 °C
Mounting position		Any desired position
Resistance to vibration		According to EN 60068-2-27 According to EN 60068-2-47 Recommended continuous duty $\leq 100\text{ m/s}^2$

Electric data			
Nominal signal	U_N	14.7 V to 24 V DC ²⁾	
Switching point	ON	$U_{80^\circ\text{C}}$	$\geq 14.7\text{ V}$
		I	$\geq 6.1\text{ mA}$

Max. operating pressure		10.0 bar
Ambient temperature ⁵⁾		-20 to +80 °C -45 to +80 °C
Conne- ction	Supply air	G ¼ or ¼ NPT and NAMUR interface ¼ ⁶⁾ with G ¾ or ¾ NPT
	Exhaust air	G ½ or ½ NPT and NAMUR interface ¼ ⁶⁾ with G ¾ or ¾ NPT
Approx. weight		1.38 kg

¹⁾ The air flow rate when $p_1 = 2.4$ bar and $p_2 = 1.0$ bar is calculated using the following formula: $Q = K_{VS} \times 36.22$ in m^3/h .

²⁾ SIL according to IEC 61508

³⁾ With internal pilot supply

⁴⁾ With external pilot supply

⁵⁾ The maximum permissible ambient temperature depends on the permissible ambient temperature of the components, type of protection and temperature class.

⁶⁾ NAMUR interface according to VDI/VDE 3845

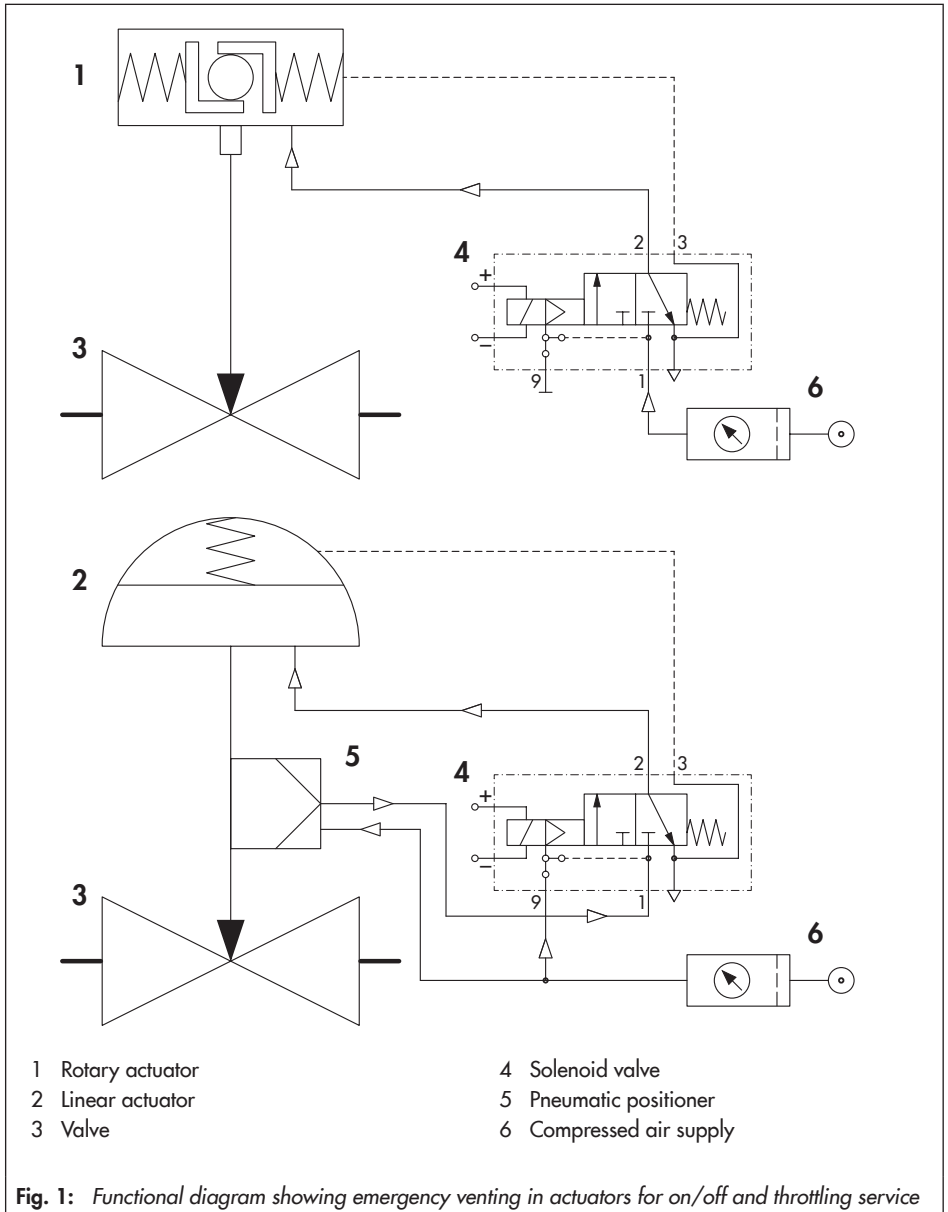

3 Safety-related functions

Emergency venting

The solenoid valve is energized by a binary voltage signal. Fail-safe action is triggered when no voltage signal (0 V DC) is applied to terminals + and -. The solenoid valve vents to the atmosphere and the actuator is vented as well (see Fig. 1).

Safety function

Safety function is triggered by the solenoid valve and upon supply air failure. The solenoid valve fully discharges its pneumatic output to the atmosphere, causing the mounted actuator to be vented. As a result, the valve moves to the fail-safe position. The fail-safe position depends on how the springs are arranged in the pneumatic actuator (air-to-close or air-to-open).

4 Mounting, connection and start-up

Refer to Mounting and Operating Instructions ► EB 3969 on how to mount, perform the electric and pneumatic connections as well as start up the solenoid valve.

Only use the specified original mounting parts and accessories.

5 Required conditions

⚠ WARNING

Risk of malfunction due to incorrect selection or wrong installation and operating conditions. Only use control valves in safety-instrumented systems after the necessary conditions in the plant have been fulfilled. This also applies to the mounted solenoid valve.

Selection

- The required transit times of the control valve are kept.
The transit times to be implemented are determined by the process engineering requirements.
- The solenoid valve is suitable for the prevailing ambient temperature.

Versions	Temperature range
All	-20 to +80 °C
With metal cable gland	-45 to +80 °C
The specifications in the test certificates additionally apply to explosion-protected versions.	

- The temperature limits are observed.

Mechanical and pneumatic installation

- The solenoid valve is mounted properly as described in the mounting and operating instructions and connected to the air supply.
- The maximum supply pressure does not exceed 10 bar.

- The pneumatic pilot supply meets the instrument air specifications.

Particle size and quantity	Oil content	Pressure dew point
Class 4	Class 3	Class 3
$\leq 5 \mu\text{m}$ and $1000/\text{m}^3$	$\leq 1 \text{ mg}/\text{m}^3$	$-20 \text{ }^\circ\text{C}$ or at least 10 K below the lowest ambient temperature to be expected

 **Tip**

We recommend installing a supply pressure regulator/filter upstream of the positioner. For example, Type 3999-009x Service Unit or Type 3999-0096 Filter Regulator can be used.

- The external pilot supply line (9) has a minimum inside diameter of 4 mm. The internal pilot supply line (1) and output (2) have a minimum inside diameter of 9 mm. See "Sizing of the connecting line" in the Mounting and Operating Instructions
 - ▶ EB 3969.
- Select the cross section and length of the line to ensure that the supply pressure at the device on filling the actuator with air does not fall below the minimum limit of 1.4 (1.9) bar.
- The solenoid valve is mounted as prescribed.
- The exhaust opening at the solenoid valve remains open when the solenoid valve is installed on site.

Electrical installation

- The solenoid valve is mounted properly as described in the mounting and operating instructions and connected to the electric power supply.
- Only cables whose outside diameters are suitable for the cable glands are used.
- The electrical cables in Ex i circuits comply with the data that planning was based on.
- The cable glands and cover screws are fastened tightly to ensure that the degree of protection is met.
- The installation requirements for the applicable explosion protection measures are observed.
- The special conditions specified in the explosion protection certificates are observed.

6 Proof testing

The proof test interval and the extent of testing lie within the operator's responsibility. The operator must draw up a test plan, in which the proof tests and the interval between them are specified. We recommend summarizing the requirements of the proof test in a checklist.

⚠ WARNING

Risk of dangerous failure due to malfunction in the event of emergency (actuator is not vented or the valve does not move to the fail-safe position).

Only use devices in safety-instrumented systems that have passed the proof test according to the test plan drawn up by the operator.

Regularly check the safety-instrumented function of the entire SIS loop. The test intervals are determined, for example on calculating each single SIS loop in a plant (PFD_{avg}).

Useful lifetime

According to IEC 61508-2, section 7.4.9.5, a useful lifetime of eight to twelve years can be assumed. Other values can be used based on the user's previous experience (prior use).

Functional test

Regularly check the safety function according to the test plan drawn up by the operator.

Refer to the SIL proof test when large deviations occur or any other irregularities. The necessary documentation for this is provided by SAMSON.

The SIL proof test can be performed by SAMSON on request.

ⓘ NOTICE

Record any faults in the solenoid valve and inform SAMSON of them in writing.

– Emergency venting through a 0 V signal

1. Apply supply air within the permissible range (max. 10 bar) to the solenoid valve which allows the control valve to move to the maximum travel/angle of rotation. On using an upstream positioner, adjust it so that the maximum output pressure is available at the positioner output.
2. Supply the solenoid valve with a voltage ≥ 14.7 V DC.
3. Check whether the control valve moves to its end position on demand.
4. Set the voltage to 0 V DC.
5. Check whether the actuator is fully vented within the demanded time.

Tip

Connect a pressure gauge to check that the actuator has completely vented.

6. Record the valve transit time and compare it to the time the valve took at start-up and during proof tests.

Visual inspection to avoid systematic failure

To avoid systematic failure, inspect the solenoid valve regularly. The frequency and the scope of the inspection lie within the operator's responsibility. Take application-specific influences into account, such as:

- Dirt blocking the pneumatic connections
- Corrosion (destruction primarily of metals due to chemical and physical processes)
- Material fatigue
- Aging (damage caused to organic materials, e.g. plastics or elastomers, by exposure to light and heat)
- Chemical attack (organic materials, e.g. plastics or elastomer, which swell, leach out or decompose due to exposure to chemicals)

NOTICE

Risk of malfunction due to the use of unauthorized parts.

Only use original parts to replace worn parts.

7 Repairs

Only perform the work on the solenoid valve described in ► EB 3969. Only use the specified original mounting parts and accessories.

NOTICE

Fail-safe action impaired due to incorrect repair.

Service and repair work must be performed by trained staff only.

8 Safety-related data

The safety-related data are listed in the TÜV Rheinland® shown on the next page.

Intended application

Sicherheitsfunktion: Bei Anforderung der Sicherheitsfunktion wird das Magnetventil durch den internen Kraftspeicher (Feder) in die Ausgangsstellung gebracht und entlüftet den angeschlossenen Antrieb.
Das Ventil ist zur Verwendung in einem sicherheitsgerichteten System bis SIL 2 (Low Demand Mode) geeignet. Unter Berücksichtigung der mindestens erforderlichen Hardware-Fehlertoleranz von HFT = 1 können die Ventile in redundanter Ausführung auch bis SIL 3 eingesetzt werden.
Safety function: When the safety function is requested, the solenoid valve is brought into its initial position by the internal force accumulator (spring) and vents the attached actuator.
The valve is suitable for use in a safety instrumented system in low demand mode up to SIL 2. Under consideration of the minimum required hardware fault tolerance HFT = 1 the valves may be used in a redundant architecture up to SIL 3.

Besondere Bedingungen

Ursprung der Werte / Origin of values

Die angegebenen Werte sind das Ergebnis umfangreicher Qualifikationstests zur Zuverlässigkeit der Sicherheitsfunktion unter kritischen Bedingungen. Zufällige und systematische Ausfälle wurden untersucht, diese liegen in der Verantwortung des Herstellers.

The stated values are the results of extensive qualification tests on the reliability of the safety function under critical conditions. Random and systematic failures which are the responsibility of the manufacturer were examined.

Systematische Tauglichkeit / Systematic Capability

Der Entwicklungs- und Herstellungsprozess sowie das vom Hersteller in den relevanten Lebenszyklusphasen des Produkts angewandte Management der funktionalen Sicherheit wurden auditiert und als geeignet für die Herstellung von Produkten für den Einsatz in Anwendungen mit einem maximalen Sicherheitsintegritätslevel von 3 (SC 3) bewertet.

The development and manufacturing process and the functional safety management applied by the manufacturer in the relevant lifecycle phases of the product have been audited and assessed as suitable for the manufacturing of products for use in applications with a maximum Safety Integrity Level of 3 (SC 3).

Wiederkehrende Prüfungen und Wartung / Periodic Tests and Maintenance

Die angegebenen Werte erfordern periodische Prüfungen und Wartungen, wie sie im Sicherheitshandbuch beschrieben sind. Der Betreiber ist verantwortlich für die Berücksichtigung spezifischer äußerer Bedingungen (z.B. Sicherstellung der geforderten Medienqualität, max. Temperatur) und adäquater Prüfzyklen.

The given values require periodic tests and maintenance as described in the Safety Manual. The operator is responsible for the consideration of specific external conditions (e.g. ensuring of required quality of media, max. temperature), and adequate test cycles.
